RESEARCH FIELDS

Primary: Environmental and Resource Economics, Climate Economics
Secondary: Political Economy, Applied Game Theory

WORKING PAPERS

Job Market Paper: **Climate Policy Uncertainty and the Green Transition**

Abstract: Carbon pricing is a key policy instrument to induce a green transition. However, political support for carbon pricing is uncertain and may change over time. I study the green transition in the electricity sector when climate policy switches stochastically between regimes with and without a carbon tax. I find that climate policy risk slows the transition: relative to a scenario in which the carbon tax is implemented permanently, green electricity capacity builds up more slowly and investment in brown capacity persists longer, resulting in higher carbon emissions during the transition. The rate at which the government switches regimes only has a limited effect on median outcomes at the end of the century, but longer expected durations widen forecast intervals for the transition paths and worsen lower-tail outcomes. This dispersion effect arises because infrequent switching makes any realized regime change more persistent, pushing the economy further from the deterministic-tax benchmark before averaging back. Thus, while frequent switching of government parties reduces the effective tax rate over the whole transition horizon, it also mitigates the risk of being stuck in a no-tax regime for most of the transition period.

Political Competition and Climate Policy: A Dynamic Game of Pollution Control

Abstract: In this paper, I analyze a dynamic game of political pollution control where two policy-motivated parties compete for votes through tax policies. Voters evaluate the direct effects of the tax policies and vote probabilistically. Depending on the voters' time horizon, the ambition of the green party's climate policy is drastically affected. If voters only consider one legislative period, the green party's climate policy is virtually indistinguishable from the brown party's to remain politically competitive. The brown party is barely affected by the political competition and can almost

exactly implement its dictatorially preferred policy. Extending the voter's time horizon allows the green party to be more ambitious and forces the brown party to move closer to the median voter's preferred policy. I find that voters would need a time horizon close to ten legislative periods for the steady-state pollution stock to be lower than under random voting. This implies that for shorter time horizons the green party is better served not making the pollution issue a political campaign topic. Increased polarization in party objectives/beliefs decreases societal welfare and increases both the level and the volatility of steady-state pollution.

Learning Dynamics in a Network of Cournot Markets

Abstract: In this paper, firms in a network of Cournot economies learn about the intercept of the demand curve using past sales history. I decompose the learning process into economically interpretable components and find that learning aggregate quantities happens at a faster rate than individual quantities both within markets and within firms. This speed depends on the network topology and the slope of the demand function. The slowest learning component is the distribution of a correct aggregate amount between markets, which drives the slow convergence of individual quantities. The convergence rate of individual quantities is the same for all sufficiently connected networks and is independent of the slope of the demand function. Increasing the density of a random network has a non-monotonic effect on the convergence speed of aggregate quantities. Convergence speeds first decrease relative to isolated market-firm pairs, increasing again after the graph becomes sufficiently connected.

TEACHING

Lecturer

Economic and Financial Networks (MSc) <i>DeGroot, SIR, interbank lending, financial contagion</i>	2024 – present, UvA
--	---------------------

Teaching Assistant

Mathematical Economics I (BSc) <i>Consumer Theory, Producer Theory, General Equilibrium, Game Theory</i>	2021 – present, UvA
Theory of Markets (MSc) <i>Producer Theory, General Equilibrium, Game Theory</i>	2021 – present, UvA
Mathematical Economics II (BSc) <i>Oligopolistic competition, Product differentiation, anticompetitive behavior</i>	2024 – present, UvA
Thesis Supervision (BSc)	2022 – present, UvA
Econometrics I (MPhil) <i>Linear Regression, Gauss-Markov, Hypothesis Testing, Maximum Likelihood, R programming</i>	2020, Tinbergen Institute
International Macroeconomics (BSc) <i>IS-LM, AS-AD, Mundell-Fleming, Exchange Rates, Monetary Policy, Fiscal Policy</i>	2018, WU

CONFERENCE PRESENTATIONS

2025: EEA (Bordeaux, France)

2024: EEA (Rotterdam, Netherlands), CEF (Singapore), WEHIA (Bamberg, Germany), EPOC Workshop (Venice, Italy)

SCHOLARSHIPS AND HONORS

2020–2021: Merit-based scholarship

Tinbergen Institute

2015–2018: Merit-based scholarship

WU

SKILLS

Computer Languages	Julia, Python, R, Mathematica
Languages	German (native), English (fluent), French (basic)

WORK EXPERIENCE

Austrian National Bank	02/2019 – 06/2019
<i>Internship in the Statistics Department</i>	<i>Vienna, Austria</i>
DZ Bank	05/2017 – 07/2017
<i>Internship in Financial and Risk Controlling</i>	<i>New York, USA</i>
Federal State Parliament	08/2016
<i>Internship in the federal state parliament</i>	<i>Vienna, Austria</i>
